

VW / SKODA IMMOBILISER

This unit is designed to work in conjunction with the in-built factory immobiliser on the vehicle.

In most immobiliser security systems it is the ECU that has to be programmed to recognise the code being sent by the vehicle immobiliser.

In the case of the VW / Audi group it is the immobiliser that has to be programmed to match the code already stored in the ECU.

Therefore, the existing immobiliser must be programmed to recognise the unique code which is stored inside this unit.

The vehicle will not run at all until this has been done using the appropriate programming equipment.

There is no method of bypassing this operation. The code stored in the ECU cannot be altered or erased.
